

Greens Update

Maintenance plan for apron and tees.

Please see details of the maintenance plan to regenerate the tees and aprons. The plan will begin once the weather allows.

1. Granular Iron(Fe) application to affect moss that is encroaching and increasing.
2. 2-3 weeks after Fe application aprons and tees to be scarified, to remove moss and decaying grass. This should allow any grass that has survived a chance to regenerate.
3. Apply pre-seeding fertiliser.
4. Overseed with fescue, dwarf rye mix using new course overseeder. Trying to get as much seed into soil contact as possible. Reason for dwarf rye is it will germinate quicker than fescue.
5. Top-dress with sand.
6. Once seed is germinated apply fertiliser which will help newly germinated grass.

NB. These actions are all weather dependent.

We would like to encourage members to help this process by-

1. When possible avoid walking on newly seeded areas.
 2. Keep trolleys off and away from these areas.
 3. Follow signage on temporary traffic managed areas.
- Your continued understanding and help is greatly appreciated.
